#### Abstract

Increasing the well-being of teachers in schools is an important issue that needs to be discussed. Nowadays, there are many problems related to the teacher, which will affect the teacher's professionalism in teaching. This systematic review aims to synthesize factors that can impact teacher welfare. The journal search database includes EBSCOHOST, PROQUEST, EmeraldInsight, and ScienceDirect, published in the last ten years (2010-2019). The keywords used are "Welfare" OR "Psychological Welfare" OR "Subjective Welfare" AND Teacher. Article selection uses PICOSS (Population, Intervention, Comparator, Result Variable, Study Design, and Setting). There are three syntheses of predictors of teacher well-being variables, namely personal factors, professional factors, and organizational factors.

Keywords: Personal Factors; Professional Factors; Organizational Factors; Well-Being; Teacher

## ■1.0 INTRODUCTION

The implementation of education is one reflection of the quality of a nation; therefore, the quality of the organization of education must be maintained. The application of learning must bring functional changes for creating a broad, equitable, and quality education system for the entire life of a country's people (Hapsari, 2016). The delivery of education is inseparable from the figure of the teaching staff, namely the teacher. The teacher is a designation for positions and professions for someone who devotes himself to education through educative interaction in a patterned, formal, and systematic manner (Shabir, 2015).

Currently, being a teacher is not easy because teachers are required to do their job as well as possible. Therefore, if the teacher does not understand the potential and limitations, it will impact the decline in teacher performance in teaching (Mafazi, 2016). As an educator, teachers are required to carry out the burden of responsibilities and obligations to develop the potential of their students. On the one hand, each teacher's responsibilities and duties have varied mainly due to the different types of education where he works. Many of these burdens and demands are then feared to make teachers not feel prosperous in the workplace (Shabir, 2015).

Several problems relating to teacher welfare, which are later feared, could hinder teachers' creation of professionalism because everyone has different perceptions about welfare(Qudsyi, 2015). Teachers need welfare to support the implementation of various job demands found in schools. In this case, work demands can create pressures that affect teachers' well-being (Wulan & Putri, 2016). Therefore, researchers currently study a lot about teacher well-being in the workplace by using several terms, including employee and workplace well-being (Burns & Machin, 2012), teacher well-being; Virtanen, Vaaland, & Ertesvåg, 2019; Hwang et al., 2019; Graham & Truscotthttps, 2019; Sasmoko, Herisetyantri, Suroso, & Ying, 2017), Psychological well-being guru (Liang, Peng, Zhao, & Wu, 2017). Some of these studies show gaps between studies because there is no common understanding of the teacher's well-being in the workplace, so it is necessary to formulate a clear concept of the teacher's well-being.

Some research results also prove that the well-being of teachers in the workplace is influenced by several factors, including occupational stress (Bahari, Lin, & Wider, 2016), self-esteem, general self-efficacy, teacher self-efficacy, optimism, and perceived social support (Stanculescu, 2014), workplace spirituality and self-esteem (Awan & Sitwat, 2014), organizational justice (Elovainio *et al.*, 2011), social support, academic functioning, and social-emotional functioning (Tennant *et al.*, 2015).

The results of the study indicate that the sources of teacher well-being are very diverse. Understanding the factors that influence teacher well-being in the workplace is essential as a reference for the preparation of teacher mental health promotion programs and developing a framework for teacher professional development. So the writing of this article aims to create a synthesis of factors that influence teacher well-being as a framework for educational researchers in education management.

#### ■2.0 LITERATURE REVIEW

Many researchers have studied the concept of well-being, but all well-being ideas come from two philosophical schools, namely hedonic and eudaimonia (Deci & Ryan, 2008). In its development, welfare research is currently dominated by two main approaches: hedonic and eudaimonic (Huta, 2015; Waterman, 1993). The hedonic approach perceives well-being subjectively so that well-being is considered the same as happiness. In contrast, the eudaimonic approach defines well-being as achieved if a person becomes a fully functioning person (Deci & Ryan, 2008).

Well-being has various definitions developed using different approaches. Danna & Griffin (1999) use the terms health and work health and well-being comfort to see workplace well-being employees' work comfort. The concept of well-being is widely applied in various fields of life, including in the world of work. Well-being shows employees' welfare as mental, physical, and health, as well as employee satisfaction both at work and outside of work (Danna & Griffin, 1999).

A teacher's workplace well-being is a positive emotional state that combines students' and teachers' needs and personal expectations. Teacher welfare and job satisfaction greatly influence teacher behavior and are positively related to school and classroom climate and student achievement (Spilt, Koomen, & Thijs, 2011). Some concepts can be interpreted as the construct of workplace well-being, namely job satisfaction, work involvement, organizational commitment, emotional involvement and positive and negative moods at work, intrinsic motivation, and enthusiasm (Fisher, 2014). Furthermore, there are four main dimensions of affective well-being, aspirations, autonomy, and competence. The affective welfare dimension consists of job satisfaction, organizational commitment, tension at work, and fatigue.

In contrast, the dimension of aspiration is the ability of individuals to achieve challenging goals at work. The autonomy dimension is related to employees' strength to meet the demands of the work environment independently. In contrast, the competency dimension contains aspects of employee self-efficacy towards their work (Warr, 1994). Based on this description, it can be concluded that workplace well-being is multidimensional.

In the world of education, the concept of workplace well-being teachers is defined as a sense of fulfillment of professional assignments, job satisfaction, the achievement of goals, and happiness built in collaboration with fellow teachers and students (Acton & Glasgow, 2015). Thus, to achieve well-being, the teacher involves the cooperation of professionalism and the relationship between the teacher and students. The concept of workplace well-being was developed based on Herzberg's motivation theory of hygiene which explains that individuals work based on intrinsic and extrinsic motivation (Page, 2005). Based on this concept, Page (2005) developed workplace well-being dimensions into two dimensions, namely the intrinsic dimension and the extrinsic dimension. The intrinsic dimension consists of responsibility in work, the meaning of work, independence at work, use of abilities at work, and feelings of achievement at work. Meanwhile, the external dimension consists of adequate time, working conditions, supervision, promotion opportunities, recognition and appreciation of work results, wages, job security.

In the world of education, the concept of teacher workplace well-being is defined as a sense of professional duty fulfillment, job satisfaction, goal achievement, and happiness built in a collaborative process with fellow teachers and students (Acton & Glasgow, 2015). Emotional and cognitive forces related to the dimension of well-being are hope, enthusiasm, gratitude, and forgiveness (Forest, Mageau, Crevier-braud, Bergeron, & Dubreuil, 2012). In Indonesia, the most dominant dimension determining teacher welfare is the cognitive dimension. This condition is also influenced by the strength of family support (Sasmoko et al., 2017). These dimensions are explained in indicators of teacher well-being, including 1) workload well-being, related to workload problems and work pressure, 2) organizational well-being, compared to teachers' perceptions of school organizations as organizations including perceptions of school leadership and teaching ability, 3) student interaction well-being, related to teacher interaction with students (understanding of student behavior, motivation) (Collie, Shapka, Perry, & Martin, 2015). This description shows that the reciprocal relationship between teacher and student becomes an essential source for achieving well-being. Thus, it appears that the teacher's well-being workplace is related to professional, organizational, and social relations aspects. Therefore, the review's systematic objective is to synthesize predictor variables from well-being teachers in schools.

#### ■3.0 METHODOLOGY

#### Literature Search

The process of finding articles that are done through an electronic database used is EBSCOHOST, PROQUEST, EmeraldInsight, and ScienceDirect. The keywords used are "Well-being" OR "Psychological Well-being" OR "Subjective Well-being" AND "Teacher." Article selection uses the PICOSS table (Dundar & Fleeman, 2017). PICOSS (Population, Intervention, Comparative, Results Variable, Study Design, and Arrangement) is used to determine detailed, clear, and relevant inclusion and exclusion criteria related to the systematic review question's essential components. Tables arranged based on PICOSS can help reviewers, especially in finding articles.

### **Inclusion and Exclusive Criteria**

After searching for various articles, then we made criteria according to the PICOSS Table below. Table 1 helps review, especially in article searches.

Table 1 Table PICOSS

Criteria	Inclusive	Exclusive		
Population	Teacher	employees other than teachers		
Intervention	-	-		
Comparison	-	-		
Output	Factor-based results that affect the	Products do not fit the research		
well-being of teachers				
Design study	Quantitative	Beyond quantitative		
		research		

Based on these criteria, the samples used are in the following Table 2.

Table 2 Data characteristics

## 4.0 RESEARCH FINDINGS

The synthesis of the study results shows that the well-being of teachers in the workplace is determined by personal, professional, and organizational factors. More details are presented in the following Figure 1:

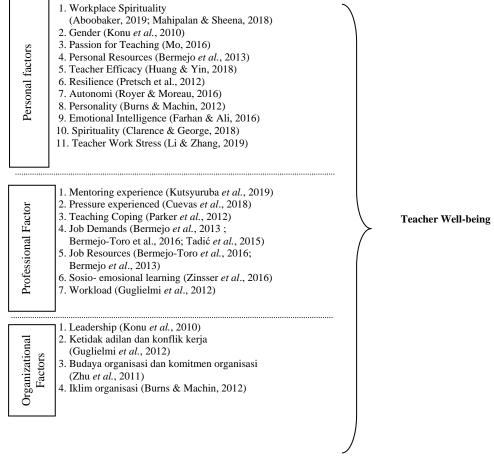

Figure 1 Synthesis of research results

## **■5.0 DISCUSSION**

Several factors that become the predictor variables of teacher well-being can be grouped into personal factors, professional factors, and organizational factors. In the paradigm of psychology, human development can be predicted from factors within the individual (determinant factors) and environmental factors (ecology). Several studies have found various personal characteristics as predictors of the achievement of well-being teachers in schools. Educating activities cannot be separated from spirituality aspects (Sandhu, 2015) because teaching work requires calls from outside human strength (Kumar, 2018). Spirituality is a fundamental part of human personality, so individuals who have a strong foundation of spirituality can be consistent in achieving organizational goals. From the research, it was found that workplace spirituality influences the well-being of teachers because workplace spirituality can allow teachers to experience meaning and purpose in their work, a sense of community through positive relationships, and the alignment of personal and organizational values may be one of the most managerial tasks important meaningful work has the most significant influence on well-being in the workplace. Someone who involves workplace spirituality in working or interacting with coworkers will feel some of the group who feel trusted, valued, and supported by their coworkers so that an understanding of workplace spirituality makes someone more caring, enthusiastic, creative, and can increase work intensity (Aboobaker, 2019; Clarence & George, 2018; Mahipalan & Sheena, 2018). Therefore teachers must involve their workplace spirituality to improve their work product to have a good impact on the work environment (Rachmah, 2016).

Personal factors also prove that Personal Resources help teachers ease the workload, achieve goals, and encourage the teaching profession's development (Burns & Machin, 2012). Self-efficacy is considered an essential part of personal factors because, with self-confidence, the teacher will manage themselves and work resources (Bermejo-Toro et al., 2016). In professional aspects, work demands and workloads are predictors of teacher well-being. Teachers who work in rural schools have different work demands than teachers who teach in urban schools. Likewise, teachers who teach many classes have different workloads than teachers who teach in schools with few students. Therefore, future researchers' well-being teachers need to pay attention to the school environment's factors, both the physical and social environment

Organizational factors also prove to be predictors of teachers' well-being in schools (Parent-Lamarche & Marchand, 2019). In organizational theory, school as an organization has four aspects: organizational goals, organizational climate, organizational structure, and organizational context, related to how schools establish communication with various parties (Bush, 2015). The theory used as the basis for studying environmental influences is an ecological theory that holds that to understand human development, one must consider the entire ecological system in which development occurs. The environment around individuals is a system layer that is constantly changing and can

affect individuals (Bronfenbrenner, 1994). The work environment directly affects work, but other ecological contexts such as family and society can also change the system in which individuals are located (Krueger, 2005).

Thus personal factors and environmental factors, especially the organizational environment, cannot be separated to predict the teacher's well-being. But most of the results of the study have not combined personal factors with organizational factors, except the results of research by Bermejo *et al.* (2013), which combines the variable job demands and job resources as well as Burns & Machin (2012), which combines personality variables and organizational climate. The achievement of well-being is determined by the interaction between personal factors and the environment (Ng & Fisher, 2013). Schools are one of the organizational units whose role is to determine teacher professionalism. If school organizations are less effective, teacher well-being will be hampered (Holmes, 2005). The multilevel determinant model explains that individuals who experience organizational stress will mobilize their internal resources to deal with them and avoid depleting resources (Marchand, Durand, Haines, & Harvey, 2015). This finding also reinforces that research that combines personal factors with organizational factors will reference teacher resource development. The teacher is in an environment that is a dynamic system and contains various strengths if various aspects of power in the joining climate will affect the teachers' condition in the system.

### ■6.0 CONCLUSION

This systematic review synthesizes factors that are predicted to influence the well-being of teachers in schools. Personal, professional, and organizational factors are proven to determine the achievement of teacher well-being. Not many researchers thoroughly examine these three factors, and most researchers partially consider these three factors. Future researchers recommend exploring personal, professional, and organizational factors together as predictors of teacher well-being.
